# Preface

These notes attempt to give a concise overview of the **Introduction to Analysis** course at the University of Tennessee (MATH 341). The contents of these notes come from Dr. Michael Frazier's lecture notes, Dr. Peter Humphries' lecture notes, and various online resources like the Mathematics Stack Exchange.

The first few weeks of the class are spent reviewing content from **Introduction to Abstract Mathematics** (MATH 300). Afterwards, we focus on analysis of real functions.

# Introduction

Our goal is to understand the theory of real functions in one variable. Specifically, we will deal with functions, limits, sequences, convergence, continuity, differentiation, and integration. The same ideas, concepts, and techniques are used to study more complicated mathematics.

We will primarily focus on the idea of **convergence**. Many computational techniques and algorithms rely on iteration—successive approximations getting closer to an actual solution. In order for those algorithms to work, they need to converge towards an actual solution.

To motivate our quest to learn about convergence, let's look at some classic iterative methods.

## Example 1.0.1 ▶ Newton's Method

Given  $c > 0$ , suppose we want to calculate  $\sqrt{c}$ . Start with some initial guess  $x_1 > 0$ .

$$\begin{aligned} \text{Let } x_2 &:= \frac{1}{2} \left( x_1 + \frac{c}{x_1} \right) \\ \text{Let } x_3 &:= \frac{1}{2} \left( x_2 + \frac{c}{x_2} \right) \\ &\vdots \\ \text{Let } x_{n+1} &:= \frac{1}{2} \left( x_n + \frac{c}{x_n} \right) \end{aligned}$$

We find that  $\lim_{n \rightarrow \infty} x_n = \sqrt{c}$ .

Does this method work for all  $c > 0$  and  $x_1 > 0$ ? Assuming  $\lim_{n \rightarrow \infty} x_n = x$  converges, then:

$$\begin{aligned} x_{n+1} &= \frac{1}{2} \left( x_n + \frac{c}{x_n} \right) \\ \implies x &= \frac{1}{2} \left( x + \frac{c}{x} \right) \\ \implies 2x &= x + \frac{c}{x} \\ \implies x &= \frac{c}{x} \\ \implies x^2 &= c \\ \implies x &= \sqrt{c} \end{aligned}$$

The above calculation only makes sense if we know the sequence converges. Consider the sequence  $x_{n+1} = 6 - x_n$  where  $x_1 = 4$ . Then:

$$x_1 = 4, \quad x_2 = 2, \quad x_3 = 4, \quad x_4 = 2, \quad \dots$$

Since this sequence does not converge, there is no limit when  $n \rightarrow \infty$ ! In chapter 14, we will cover the Monotone Convergence Theorem, which states that any bounded monotone sequence converges.

### Example 1.0.2 ► Monotone Convergence Theorem

Suppose that  $c > 0$  and  $x_1 > 0$ . Then, for  $n \geq 2$ , the sequence  $x_{n+1} = \frac{1}{2} \left( x_n - N + \frac{c}{x_n} \right)$  is:

- **bounded below** because  $x_n > \sqrt{c}$  when  $n \geq 2$ , and
- **decreasing** because  $x_{n+1} < x_n$  for  $n \geq 2$ .

Therefore,  $x_n$  converges by the Monotone Convergence Theorem, and  $\lim_{n \rightarrow \infty} x_n = \sqrt{c}$ .

Let's look at a more complicated iterative method.

### Example 1.0.3 ► Picard's Method

Suppose we had to solve  $y' = f(x, y)$  where  $y(x_0) = y_0$  (i.e. find a function  $y$  that satisfies our two conditions). As it turns out, we can use an iterated method to solve this as well.

- Start with an initial guess  $y_1(x)$
- Define  $y_{n+1}(x) := y_0 + \int_{x_0}^x f(t, y_n) dt$ .

Provided that  $f$  and  $y_0$  are “well-behaving”, then the sequence of functions  $y_n(x)$  converges to the solution  $y(x)$ .

The idea that an infinite sequence of functions can converge suggests some notion of “distance” between functions. We can use a number of metrics for distance, some possibilities including:

- $\int_a^b |f(x) - g(x)| dx$  (total area between the two functions)
- $\sup \{ |x| : x = |f(x) - g(x)| \}$  (max possible “vertical” distance between the two curves)

# Logic and Proofs

Logic is the backbone of all formal mathematics. When building a logically sound model of mathematics, we start with a small collection of axioms. We then work with those axioms to deduce other logically sound statements, reaffirming what we already knew and discovering new ideas along the way.

## 2.1 Basic Logic

### Definition 2.1.1 ► Statement

A **statement** is a claim that is either true or false.

$$p : \text{some claim}$$

We usually denote statements with a letter like  $p$ . For example, we can write “ $p : x > 2$ ”, which means  $p$  represents the statement “ $x$  is greater than 2”. Throughout this chapter, we will use  $p$  and  $q$  to represent arbitrary statements.

### Definition 2.1.2 ► Conjunction

The **conjunction** of two statements is itself a statement, which is true if and only if the two statements are both true.

$$p \wedge q : p \text{ is true and } q \text{ is true}$$

### Definition 2.1.3 ► Disjunction

The **disjunction** of two statements is itself a statement, which is true if and only if at least one of the statements is true.

$$p \vee q : p \text{ is true or } q \text{ is true}$$

Conjunction and Disjunction follow our intuition of “and” and inclusive “or”, respectively. We can visualize the two logical connectives using **truth tables**.

**Example 2.1.1 ▶ Truth Table of Conjunction**

$p$	$q$	$p \Rightarrow q$
T	T	T
T	F	F
F	T	F
F	F	F

**Example 2.1.2 ▶ Truth Table of Disjunction**

$p$	$q$	$p \Rightarrow q$
T	T	T
T	F	T
F	T	T
F	F	F

**Definition 2.1.4 ▶ Negation**

The **negation** of a statement is a statement with opposite truth values.

$$\neg p$$

**Definition 2.1.5 ▶ Implication**

An **implication** “ $p$  implies  $q$ ” states “if  $p$  is true, then  $q$  is true”.

$$p \Rightarrow q$$

In the implication  $p \Rightarrow q$ , we call  $p$  the **hypothesis** and  $q$  the **conclusion**. If the hypothesis is false to begin with, then the implication is not really meaningful. Instead of assigning those kinds of implications no truth value, we simply consider them true by convention. These kinds of truths are called **vacuous truths**.

**Example 2.1.3 ▶ Truth Table of Implication**

$p$	$q$	$p \implies q$
T	T	T
T	F	F
F	T	T
F	F	T

**Example 2.1.4 ▶ Simple Statements**

Let  $p : x > 2$  and  $q : x^2 > 1$ . Consider the following statements:

- “For all real numbers  $x$ ,  $p \implies q$ ”

**True.** If  $x > 2$ , then  $x^2 > 1$ .<sup>a</sup>

- “For all real numbers  $x$ ,  $q \implies p$ ”

**False.** Consider  $x = 1.1$ . Then  $x^2 = 1.21 > 1$ , but  $x = 1.1 < 2$ .

<sup>a</sup>This is normally where we would rigorously prove such a statement, but we will omit this for now.

**Definition 2.1.6 ▶ Logical Equivalence**

$p$  and  $q$  are **logically equivalent** if  $p \implies q$  and  $q \implies p$ .

$$p \iff q$$

In other words,  $p \iff q$  means that  $p$  and  $q$  share the same truth value. Either  $p$  and  $q$  are **always both true**, or  $p$  and  $q$  are **always both false**. Logical equivalence says nothing about the truth of  $p$  and  $q$  themselves.

We can also say “ $p$  if and only if  $q$ ” or “ $p$  iff  $q$ ” to denote logical equivalence.

**Example 2.1.5 ▶ Truth Table of Logical Equivalence**

$p$	$q$	$p \iff q$
T	T	T
T	F	F
F	T	F
F	F	T

**Definition 2.1.7 ▶ Converse**

Given the implication  $p \implies q$ , its **converse** statement is  $q \implies p$ .

It's important to note that an implication and its converse have no intrinsic equivalence.

**Example 2.1.6 ▶ Truth Table of Converse**

$p$	$q$	$p \implies q$	$q \implies p$
T	T	T	T
T	F	F	T
F	T	T	F
F	F	T	T

**Definition 2.1.8 ▶ Contrapositive**

Given the implication  $p \implies q$ , its **contrapositive** statement is  $\neg q \implies \neg p$ .

Unlike the converse, an implication and its contrapositive are logically equivalent. To help our intuition, we can construct a truth table.

**Example 2.1.7 ▶ Truth Table of Contrapositive**

$p$	$q$	$\neg p$	$\neg q$	$p \implies q$	$\neg q \implies \neg p$
T	T	F	F	T	T
T	F	F	T	F	F
F	T	T	F	T	T
F	F	T	T	T	T

As we can see, no matter what the truth values of the hypothesis and conclusion are, an implication and its contrapositive always have the same truth values.

When constructing a truth table, we must include **all** intermediate statements, not just the final statement.

## 2.2 Proofs and Proof Techniques

While truth tables are a quick way to gauge whether simple statements hold, they become impractical once we involve more complicated statements. Furthermore, truth tables don't really show intuition behind complicated statements whereas proofs should ultimately fuel our intuition.

Very often, we will have to prove some implication like  $p \implies q$ . Recall how an implication is only false if  $p$  is true but  $q$  is false. Therefore, we would only have to consider that case where  $p$  is true but  $q$  is false. We can prove an implication is true by simply showing that such a case could never happen. There are three simple proof techniques for doing so:

1. **Direct Proof:** Assume  $p$  is true, then reason that  $q$  must be true as well.
2. **Proof by Contradiction:** Assume both  $p$  and  $\neg q$  are true, then logically derive some contradiction.
3. **Proof by Contrapositive:** Assume  $\neg q$  is true, then reason that  $\neg p$  must be true as well.

In a direct proof, the reasoning to get from  $p$  to  $q$  provides a lot of insight about the context of  $p$  and the surrounding mathematics. Similarly, the direct reasoning in proof by contrapositive provides context surrounding  $\neg q$ . However, the reasoning done in a proof by contradiction is based on a contradictory hypothesis. Thus, it is often less insightful and is typically avoided

when a direct proof is readily available.<sup>1</sup>

That being said, it is sometimes easier to find a proof by contradiction than a direct proof. Whereas direct proof needs to deduce the correct path that leads to the conclusion, a proof by contradiction only needs to deduce any contradictory statement.

### Technique 2.2.1 ▶ Proof by Contradiction

To prove  $p \implies q$  by contradiction, we carry out the following steps:

1. Assume  $p$  is true, and suppose for the sake of contradiction  $\neg q$  is true.
2. Logically derive a statement that contradicts something we know to be true.
3. Ultimately conclude that  $q$  must be true.

In terms of logic notation, proof by contradiction follows:

$$[(p \wedge (\neg q)) \implies \text{Contradiction}] \implies [p \implies q]$$

### Example 2.2.1 ▶ Truth Table of Proof by Contradiction

$p$	$q$	$p \implies q$	$\neg q$	$p \wedge (\neg q)$	$\neg [p \wedge (\neg q)]$
T	T	T	F	F	T
T	F	F	T	T	F
F	T	T	F	F	T
F	F	T	T	F	T

By the above truth table, we can safely assume the following logical equivalence:

$$(p \implies q) \iff \neg [p \wedge (\neg q)]$$

### Technique 2.2.2 ▶ Proof by Contrapositive

To prove  $p \implies q$  by contrapositive, we carry out the following steps:

1. Assume  $\neg q$  is true.

<sup>1</sup><https://math.stackexchange.com/a/1688>

## 2. Directly prove that $\neg p$ is true.

In terms of logic notation, proof by contrapositive follows:

$$(\neg q \implies \neg p) \iff (p \implies q)$$

We can actually prove this using proof by contradiction!

### Example 2.2.2 ▶ Logical Equivalence of Contrapositive

Given statements  $p$  and  $q$ ,  $p \implies q$  and  $\neg q \implies \neg p$  are equivalent.

*Proof.* Assume  $p \implies q$ . To prove  $\neg q \implies \neg p$ , we can suppose for contradiction that  $\neg q$  and  $p$  are both true. But  $p \implies q$ , so  $q$  is true which contradicts  $\neg q$ . Hence, the assumption that  $p$  is true was incorrect. Thus,  $\neg q \implies \neg p$ .

Assume  $\neg q \implies \neg p$ . From above, we have  $\neg(\neg p) \implies \neg(\neg q)$ , so  $p \implies q$ . □

### Example 2.2.3 ▶ Proving Simple Logic Statements

Let  $p$ ,  $q$ , and  $r$  be arbitrary statements. Prove that  $[p \implies (q \vee r)] \iff [(p \wedge \neg q) \implies r]$ .

*Proof.* Assume  $p \implies (q \vee r)$ . Suppose  $p \wedge \neg q$ . Then  $p$  is true, so  $q \vee r$  is true by assumption. Also,  $\neg q$  is true, so  $r$  must be true from  $q \vee r$ .

Assume  $(p \wedge \neg q) \implies r$ . Suppose  $p$  is true. There are two possibilities:

1. If  $q$  is true, then  $q \vee r$  is true.
2. If  $\neg q$  is true, then  $p \wedge \neg q$  is true. Thus,  $r$  is true by assumption. Hence,  $q \vee r$  is true.

□

# Naive Set Theory

Set theory is a whole other can of worms that really isn't that meaningful right now. Instead of constructing an axiomatic basis for sets, we will just take a naive approach and define sets informally. That way, we can avoid the chicanery and get to what really matters.

## 3.1 Sets

### Definition 3.1.1 ► Set

A **set** is a collection of distinct objects.

For example,  $\mathbb{N} := \{1, 2, 3 \dots\}$  is the set of all natural numbers, and  $\mathbb{Z} := \{\dots, 1, 2, 3, \dots\}$  is the set of all integers. It's conventional to use capital letters to denote sets and use lowercase letters to denote elements of sets. Throughout this chapter, we will use  $A$  and  $B$  to represent arbitrary sets.

### Definition 3.1.2 ► Membership, $\in$

We write  $a \in A$  to mean “ $a$  is in  $A$ ”.

### Definition 3.1.3 ► Subset, $\subseteq$

$A$  is a **subset** of  $B$  if everything in  $A$  is also in  $B$ .

$$A \subseteq B \iff \forall (x \in A)(x \in B)$$

### Definition 3.1.4 ► Set Equality, $=$

$A$  **equals**  $B$  if  $A$  is a subset of  $B$  and  $B$  is a subset of  $A$ .

$$A = B \iff (A \subseteq B \wedge B \subseteq A)$$

### Definition 3.1.5 ► Proper Subset, $\subsetneq$

$A$  is a **proper subset** of  $B$  if  $A$  is a subset of  $B$  but  $B$  is not a subset of  $A$ .

$$A \subsetneq B \iff (A \subseteq B \wedge B \not\subseteq A)$$

In other words,  $A$  is a proper subset of  $B$  if everything in  $A$  is also in  $B$ , but  $B$  has something that  $A$  does not.

Among mathematics textbook, the generic subset symbol  $\subset$  has no standardized definition. Some use it to represent subset or equal; others use it to represent proper subset. We will simply avoid using  $\subset$  to avoid any ambiguity.

### Definition 3.1.6 ► Empty Set ( $\emptyset$ )

The **empty set** is the set that contains no elements.

$$\emptyset := \{\}$$

As a convention, we will assume that  $\emptyset$  is a subset of any set, including itself.

### Technique 3.1.1 ► Proving a Subset Relation

To prove that  $A \subseteq B$ :

1. Let  $x$  be an arbitrary element of  $A$ .
2. Show that  $x \in B$ .

To prove that  $A \not\subseteq B$ , choose a specific  $x \in A$  and show  $x \notin B$ .

### Example 3.1.1 ► Proving Simple Subset Relation

Suppose that  $A \subseteq B$  and  $B \subseteq C$ . Prove that  $A \subseteq C$ .

*Proof.* Let  $x \in A$  be arbitrary. Since  $A \subseteq B$ , then  $x \in B$ . Similarly, since  $B \subseteq C$ , then  $x \in C$ . Therefore,  $A \subseteq C$ . □

### Definition 3.1.7 ► Union

The **union** of two sets is the set of all things that are in one or the other set.

$$A \cup B := \{x : x \in A \vee x \in B\}$$

### Definition 3.1.8 ► Intersection

The **intersection** of two sets is the set of all things that are in both sets.

$$A \cap B := \{x : x \in A \wedge x \in B\}$$

More generally, we can apply union and intersection to an arbitrary number of sets, finite or infinite. We use a notation similar to summation using  $\sum$ . Let  $\Lambda$  be an indexing set, and for each  $\lambda \in \Lambda$ , let  $A_\lambda$  be a set.

$$\bigcup_{\lambda \in \Lambda} A_\lambda = \{x : x \in A_\lambda \text{ for some } \lambda \in \Lambda\}$$

$$\bigcap_{\lambda \in \Lambda} A_\lambda = \{x : x \in A_\lambda \text{ for all } \lambda \in \Lambda\}$$

### Example 3.1.2 ► Indexed Sets

For  $n \in \mathbb{N}$ , let  $A_n = \left[\frac{1}{n}, 1\right] = \left\{x \in \mathbb{R} : \frac{1}{n} \leq x \leq 1\right\}$ . Prove that:

(a)  $\bigcup_{n=1}^{\infty} A_n = (0, 1]$

(b)  $\bigcap_{n=1}^{\infty} A_n = \{1\}$

*Proof of (a).* Suppose  $x \in \bigcup_{n=1}^{\infty} A_n$ . Then there exists  $n \in \mathbb{N}$  such that  $x \in A_n = \left[\frac{1}{n}, 1\right]$ . That is,  $0 < \frac{1}{n} \leq x \leq 1$ . Therefore,  $x \in (0, 1]$ .

Suppose  $x \in (0, 1]$ . Then  $x > 0$ , so there exists  $n_0 \in \mathbb{N}$  such that  $\frac{1}{n_0} < x$ . Then  $\frac{1}{n_0} \leq x \leq 1$ , so  $x \in A_{n_0}$ . Therefore,  $x \in \bigcup_{n=1}^{\infty} A_n$ .  $\square$

*Proof of (b).* Suppose  $x \in \bigcap_{n=1}^{\infty} A_n$ . Then  $x \in A_1 = \{1\}$ .

Suppose  $x \in \{1\}$ . Then  $x = 1 \in \left[\frac{1}{n}, 1\right]$  for all  $n \in \mathbb{N}$ . Therefore,  $x \in \bigcap_{n=1}^{\infty} A_n$ .  $\square$

### Definition 3.1.9 ► Set Minus

The **set difference** of two sets is the set of all things that are in first set but not the second set.

$$A \setminus B = \{x \in A : x \notin B\}$$

### Definition 3.1.10 ► Complement

Let  $X$  be a set called the **universal set**. The **complement** of  $A$  in  $X$  is defined as  $X \setminus A$ .

$$A^c = X \setminus A = \{x \in X : x \notin A\}$$

**Theorem 3.1.1 ▶ De Morgan's Laws for Sets**

Suppose  $X$  is a set, and for any subset  $S$  of  $X$ , let  $S^c = X \setminus S$ . Suppose that  $A_\lambda \subseteq X$  for every  $\lambda$  belonging to some index set  $\Lambda$ . Prove that:

$$(a) \left( \bigcup_{\lambda \in \Lambda} A_\lambda \right)^c = \bigcap_{\lambda \in \Lambda} A_\lambda^c;$$

$$(b) \left( \bigcap_{\lambda \in \Lambda} A_\lambda \right)^c = \bigcup_{\lambda \in \Lambda} A_\lambda^c.$$

*Proof of (a).* First, let  $a \in \left( \bigcup_{\lambda \in \Lambda} A_\lambda \right)^c$ . Then,  $a \in X \setminus \left( \bigcup_{\lambda \in \Lambda} A_\lambda \right)$ , so  $a \in X$  but  $a \notin \left( \bigcup_{\lambda \in \Lambda} A_\lambda \right)$ . Thus,  $a \notin A_\lambda$  for any  $\lambda \in \Lambda$ , so  $a \in X \setminus A_\lambda$  for all  $\lambda \in \Lambda$ . In other words,  $a \in \bigcap_{\lambda \in \Lambda} A_\lambda^c$ .

Next, let  $a \in \bigcap_{\lambda \in \Lambda} A_\lambda^c$ . Then  $a \in A_\lambda^c$  for all  $\lambda \in \Lambda$ , so  $a \in X$  but  $a \notin A_\lambda$  for all  $\lambda \in \Lambda$ . That is,  $a \notin \left( \bigcup_{\lambda \in \Lambda} A_\lambda \right)$ . In other words,  $a \in \left( \bigcup_{\lambda \in \Lambda} A_\lambda \right)^c$ .  $\square$

*Proof of (b).* First, let  $a \in \left( \bigcap_{\lambda \in \Lambda} A_\lambda \right)^c$ . Then,  $a \in X \setminus \bigcap_{\lambda \in \Lambda} A_\lambda$ , so  $a \in X$  but  $a \notin \bigcap_{\lambda \in \Lambda} A_\lambda$ . That is,  $a \notin A_\lambda$  for some  $\lambda \in \Lambda$ . Thus,  $a \in X \setminus A_\lambda$  for some  $\lambda \in \Lambda$ . Therefore,  $a \in \bigcup_{\lambda \in \Lambda} A_\lambda^c$ .

Next, let  $a \in \bigcup_{\lambda \in \Lambda} A_\lambda^c$ . Then  $a \in A_\lambda^c$  for some  $\lambda \in \Lambda$ , so  $a \in X$  but  $a \notin A_\lambda$  for some  $\lambda \in \Lambda$ . That is,  $a \notin \left( \bigcap_{\lambda \in \Lambda} A_\lambda \right)$ . Therefore,  $a \in \left( \bigcap_{\lambda \in \Lambda} A_\lambda \right)^c$ .  $\square$

## 3.2 Functions

We generally think of functions as a “map” or “rule” that assigns numbers to other numbers. For example,  $f(x) = 2x$  maps  $1 \mapsto 2$ ,  $2 \mapsto 4$ , etc. In formal mathematics, it's conventional to actually define functions in terms of sets.

**Definition 3.2.1 ▶ Cartesian Product**

Let  $X$  and  $Y$  be sets. The **Cartesian product** of  $X$  and  $Y$  is the set of all ordered pairs  $(x, y)$  where  $x \in X$  and  $y \in Y$ .

$$X \times Y := \{(x, y) : x \in X \wedge y \in Y\}$$

**Definition 3.2.2 ▶ Relation**

Let  $X$  and  $Y$  be sets. A **relation** between  $A$  and  $B$  is a subset of the Cartesian product  $A \times B$ .

**Definition 3.2.3 ▶ Function**

Let  $X$  and  $Y$  be sets. A **function** from  $X$  to  $Y$  is a subset of  $X \times Y$  such that for every  $x \in X$ , there exists a unique  $y \in Y$  where  $(x, y) \in f$ .

More formally, a **function**  $f : X \rightarrow Y$  is a subset of  $X \times Y$  satisfying:

1.  $\forall(x \in X) [\exists(y \in Y)((x, y) \in f)]$
2.  $(x, y_1), (x, y_2) \in f \implies y_1 = y_2$

Given  $f : X \rightarrow Y$ , we call  $X$  the **domain** of  $f$  and  $Y$  the **codomain** of  $f$ . Given  $x \in X$ , we write  $f(x)$  to denote the unique element of  $Y$  such that  $(x, y) \in f$ .

$$f(x) = y \iff (x, y) \in f$$

**Definition 3.2.4 ▶ Function Image**

Let  $f : X \rightarrow Y$  be a function and  $A \subseteq X$ . The **image** of  $A$  under  $f$  is the set containing all possible function outputs from all inputs in  $A$ .

$$f[A] := \{f(a) : a \in A\}$$

Given  $f : X \rightarrow Y$ , we call  $f[X]$  the **range** of  $f$ .

**Example 3.2.1 ▶ Function Images**

Suppose  $f : X \rightarrow Y$  is a function, and  $A_\lambda \subseteq X$  for each  $\lambda \in \Lambda$ . Then:

- (a)  $f\left[\bigcup_{\lambda \in \Lambda} A_\lambda\right] = \bigcup_{\lambda \in \Lambda} f[A_\lambda]$
- (b)  $f\left[\bigcap_{\lambda \in \Lambda} A_\lambda\right] \subseteq \bigcap_{\lambda \in \Lambda} f[A_\lambda]$

In this example, we will only prove the “forward” direction. That is, we want to show that  $f\left[\bigcup_{\lambda \in \Lambda} A_\lambda\right] \subseteq \bigcup_{\lambda \in \Lambda} f[A_\lambda]$ .

*Proof of (a).* Let  $y \in f\left[\bigcup_{\lambda \in \Lambda} A_\lambda\right]$ . By definition of Function Image, there exists  $x \in \bigcup_{\lambda \in \Lambda} A_\lambda$  such that  $y = f(x)$ . Thus, there exists  $\lambda_0 \in \Lambda$  such that  $x \in A_{\lambda_0}$ . That is,

$y \in f[A_{\lambda_0}]$ . Therefore,  $y \in \bigcup_{\lambda \in \Lambda} f[A_\lambda]$ . □

### Definition 3.2.5 ▶ Function Inverse Image

Let  $f : X \rightarrow Y$  be a function and  $B \subseteq Y$ . The **inverse image** of  $B$  under  $f$  is the set containing all possible function inputs whose output is in  $B$ .

$$f^{-1}[B] := \{x \in X : f(x) \in B\}$$

Note the following logical equivalence:

$$x \in f^{-1}[B] \iff f(x) \in B$$

### Example 3.2.2 ▶ Function Inverse Images

Suppose  $f : X \rightarrow Y$  is a function, and  $B_\lambda \subseteq Y$  for each  $\lambda \in \Lambda$ . Then:

$$f^{-1}\left[\bigcup_{\lambda \in \Lambda} B_\lambda\right] = \bigcup_{\lambda \in \Lambda} f^{-1}[B_\lambda]$$

Again, we will only prove the “forward direction”.

*Proof.* Let  $x \in f^{-1}\left[\bigcup_{\lambda \in \Lambda} B_\lambda\right]$ . Then,  $f(x) \in \bigcup_{\lambda \in \Lambda} B_\lambda$ . That is,  $f(x) \in B_{\lambda_0}$  for some  $\lambda_0 \in \Lambda$ . Thus,  $x \in f^{-1}[B_{\lambda_0}]$ , so  $x \in \bigcup_{\lambda \in \Lambda} f^{-1}[B_\lambda]$ . □

## 3.3 Injective and Surjective

### Definition 3.3.1 ▶ Injective

A function  $f : X \rightarrow Y$  is **injective** if no two inputs in  $X$  have the same output in  $Y$ .

$$\forall (x_1, x_2 \in X) [x_1 \neq x_2 \implies f(x_1) \neq f(x_2)]$$

### Technique 3.3.1 ▶ Proving a Function is Injective

To prove a function  $f : X \rightarrow Y$  is injective:

1. Let  $x_1, x_2 \in X$  where  $f(x_1) = f(x_2)$ .

2. Reason that  $x_1 = x_2$ .

### Example 3.3.1 ▶ Proving Injectivity

$f(x) = -3x - 7$  is injective.

*Proof.* Suppose  $f(x_1) = f(x_2)$ . Then  $-3x_1 + 7 = -3x_2 + 7$ , so  $-3x_1 = -3x_2$ . Thus,  $x_1 = x_2$ , so  $f$  is injective.  $\square$

### Example 3.3.2 ▶ Disproving Injectivity

Prove that  $f(x) = x^2$  is not injective.

*Proof.*  $f(-1) = 1$  and  $f(1) = 1$ , but  $-1 \neq 1$ . Thus,  $f$  is not injective.  $\square$

### Definition 3.3.2 ▶ Surjective

A function  $f : X \rightarrow Y$  is **surjective** if everything in  $Y$  has a corresponding input in  $X$ .

$$\forall(y \in Y)[\exists(x \in X)(f(x) = y)]$$

Note that  $f : X \rightarrow f[X]$  is **always** surjective.

### Technique 3.3.2 ▶ Proving a Function is Surjective

To prove a function  $f : X \rightarrow Y$  is surjective:

1. Let  $y \in Y$  be arbitrary.
2. “Undo” the function  $f$  to obtain  $x \in X$  where  $f(x) = y$ .

### Example 3.3.3 ▶ Proving Surjectivity

Prove that  $f : \mathbb{R} \rightarrow \mathbb{R}$  defined by  $f(x) = -3x + 7$  is surjective.

*Proof.* Let  $y \in Y$  be arbitrary. Let  $x := \frac{y-7}{-3}$ . Then  $x \in \mathbb{R}$ , and:

$$\begin{aligned} f(x) &= -3\left(\frac{y-7}{-3}\right) + 7 \\ &= (y-7) + 7 \\ &= y \end{aligned}$$

Therefore,  $f$  is surjective. □

### Definition 3.3.3 ► Bijective

A function  $f : X \rightarrow Y$  is **bijective** if it is both injective and surjective.

### Definition 3.3.4 ► Function Composition

Let  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$  be functions. The **composition** of  $f$  and  $g$  is a function  $g \circ f : X \rightarrow Z$  defined by:

$$(g \circ f)(x) := g(f(x))$$

### Theorem 3.3.1 ► Composition Preserves Injectivity and Surjectivity

Suppose  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$  are functions.

- (a) If  $f$  and  $g$  are injective, then  $g \circ f$  is injective.
- (b) If  $f$  and  $g$  are surjective, then  $g \circ f$  is surjective.
- (c) If  $f$  and  $g$  are bijective, then  $g \circ f$  is bijective.

*Proof of (a).* Let  $x_1, x_2 \in X$ . Suppose that  $(g \circ f)(x_1) = (g \circ f)(x_2)$ . Then,  $g(f(x_1)) = g(f(x_2))$ . Because  $g$  is injective, we have  $f(x_1) = f(x_2)$ . Because  $f$  is injective, we have  $x_1 = x_2$ . Therefore,  $g \circ f$  is injective. □

*Proof of (b).* Let  $z \in Z$ . Because  $g$  is surjective, there exists an element  $y \in Y$  such that  $g(y) = z$ . Because  $f$  is surjective, there exists an element  $x \in X$  such that  $f(x) = y$ . Thus,  $(g \circ f)(x) = g(f(x)) = g(y) = z$ . Therefore,  $g \circ f$  is surjective. □

*Proof of (c).* We know that from (a) and (b) composition preserves injectivity and surjectivity. Thus, composition must also preserve bijectivity. □

### Definition 3.3.5 ► Inverse Function

Let  $f : X \rightarrow Y$  be a bijection. The **inverse function** of  $f$  is a function  $f^{-1} : Y \rightarrow X$  defined by:

$$f^{-1} := \{(y, x) \in Y \times X : (x, y) \in f\}$$

The notation for inverse functions conflicts with the notation for inverse images. A key distinction to make it that only bijections can have an inverse function, but we can apply the

inverse image to any function. Thus, given a bijection  $f : X \rightarrow Y$ , we know  $f^{-1}(f(x)) = x$  for all  $x \in X$ , and  $f(f^{-1}(y)) = y$  for all  $y \in Y$ .

**Example 3.3.4**

Let  $f : X \rightarrow Y$  and  $g : Y \rightarrow X$  be functions such that  $(g \circ f)(x) = x$  for all  $x \in X$ , and  $(f \circ g)(y) = y$  for all  $y \in Y$ .  $f^{-1} = g$ .

*Proof.* todo: finish proof

# Number Systems

Our goal is to create an axiomatic basis for the real numbers  $\mathbb{R}$ . We need to establish axioms for  $\mathbb{R}$  and then derive all further properties from the axioms. We would like these axioms to be as minimal and agreeable as possible; however, finding axioms that characterize  $\mathbb{R}$  is not easy. Instead, we'll start from the natural numbers  $\mathbb{N}$  and expand from there.

## 4.1 Natural Numbers $\mathbb{N}$ and Induction

How do we define the natural numbers? Listing every natural number is definitely not an option. We could try to define the natural numbers as  $\mathbb{N} := \{1, 2, \dots\}$ . However, the “...” is ambiguous. Instead, we can define  $\mathbb{N}$  in terms of its properties.

### Definition 4.1.1 ► Peano Axioms for $\mathbb{N}$

The **Peano axioms** are five axioms that can be used to define the natural numbers  $\mathbb{N}$ .

1.  $1 \in \mathbb{N}$
2. Every  $n \in \mathbb{N}$  has a successor called  $n + 1$ .
3. 1 is **not** the successor of any  $n \in \mathbb{N}$ .
4. If  $n, m \in \mathbb{N}$  have the same successor, then  $n = m$ .
5. If  $1 \in S$  and every  $n \in S$  has a successor, then  $\mathbb{N} \subseteq S$ .

Note that there is not one “prescribed” way to do define the natural numbers. This is just the most popular approach.

From the fifth axiom, we can derive a new proof technique for proving an arbitrary statement for all natural numbers.

### Theorem 4.1.1 ► Principle of Induction

Let  $P(n)$  be a statement for each  $n \in \mathbb{N}$ . Suppose that:

1.  $P(1)$  is true, and
2. if  $P(n)$  is true, then  $P(n + 1)$  is true.

Then  $P(n)$  is true for all  $n \in \mathbb{N}$ .

*Proof.* Let  $S := \{n \in \mathbb{N} : P(n)\}$ . Then  $1 \in S$  because  $P(1)$  is true. Note that if  $n \in S$ , then  $P(n)$  is true. Hence,  $P(n+1)$  is true by assumption, so  $n+1 \in S$ . By the fifth Peano axiom, we have  $\mathbb{N} \subseteq S$ . Since  $S$  was defined as a subset of  $\mathbb{N}$ , we have  $\mathbb{N} = S$ . Therefore,  $P(n)$  is true for all  $n \in \mathbb{N}$ .  $\square$

A proof by induction kind of has a “domino effect”. We set up the dominoes by proving  $P(n) \implies P(n+1)$  and knock over the first domino by proving  $P(1)$ . The result is that all the dominoes will topple each other, leaving no domino standing.

$$\underbrace{P(1)}_{\text{by 1.}} \implies \underbrace{P(2)}_{\text{by 2.}} \implies \underbrace{P(3)}_{\text{by 2.}} \implies \dots$$

#### Technique 4.1.1 ► Proof by Induction

To prove a statement  $P(n)$  for all  $n \in \mathbb{N}$ , we need two things:

1. **Base Case:** Prove  $P(1)$ .
2. **Induction Step:** Assume  $P(n)$  is true from some  $n \in \mathbb{N}$ , then prove  $P(n) \implies P(n+1)$ .

It is crucial that we actually use our assumption that  $P(n)$  is true in the induction step. Otherwise, our proof is most likely wrong.

#### Example 4.1.1 ► Simple Proof by Induction

Prove that  $1 + 2 + \dots + n = \frac{n(n+1)}{2}$  for all  $n \in \mathbb{N}$ .

*Proof.* Let  $P(n)$  be the statement  $1 + 2 + \dots + n = \frac{n(n+1)}{2}$ .

**Base Case:** When  $n = 1$ , LHS = 1 and RHS =  $\frac{1(1+1)}{2} = 1$ , so  $P(1)$  is true.

**Induction Step:** Assume that  $P(n)$  is true for some  $n \in \mathbb{N}$ . Then:

$$\begin{aligned} 1 + 2 + \dots + n + (n+1) &= \frac{n(n+1)}{2} + (n+1) \\ &= (n+1) \left( \frac{n}{2} + 1 \right) \\ &= \frac{(n+1)(n+2)}{2} \end{aligned}$$

That is,  $P(n + 1)$  is true. By the Principle of Induction,  $P(n)$  is true for all  $n \in \mathbb{N}$ . □

## 4.2 Integers $\mathbb{Z}$

From the natural numbers, we can easily construct the integers. First, we assume the existence of an operation, addition (+) and multiplication ( $\cdot$ ). On  $\mathbb{N}$ , we assume addition and multiplication satisfy the following properties for all  $a, b, c \in \mathbb{N}$ :

- **Commutativity**     $a + b = b + a$                        $a \cdot b = b \cdot a$
- **Associativity**     $(a + b) + c = a + (b + c)$      $(a \cdot b) \cdot c = a \cdot (b \cdot c)$
- **Distributivity**     $a \cdot (b + c) = a \cdot b + a \cdot c$
- **Identity**             $1 \cdot n = n$

We can expand this number system by including:

1. an **additive identity** ( $n + 0 = n$  for all  $n \in \mathbb{N}$ )
2. **additive inverses** (for all  $n \in \mathbb{N}$ , add  $-n$  so  $-n + n = 0$ )

From this, we can construct the set of integers.

### Definition 4.2.1 ► Integers $\mathbb{Z}$

The set of **integers** is defined as:

$$\mathbb{Z} := \mathbb{N} \cup \{0\} \cup \{-n : n \in \mathbb{N}\}$$

### Definition 4.2.2 ► Even, Odd, Parity

Let  $a \in \mathbb{Z}$ .

- $a$  is **even** if there exists  $k \in \mathbb{Z}$  where  $a = 2k$ .
- $a$  is **odd** if there exists  $k \in \mathbb{Z}$  where  $a = 2k + 1$ .
- **Parity** describes whether an integer is even or odd.

### Theorem 4.2.1 ► Parity Exclusivity

Every integer is either even or odd, never both.

TODO: prove this

**Example 4.2.1 ▶ Parity of Square**

For  $n \in \mathbb{Z}$ , if  $n^2$  is even, then  $n$  is even.

*Proof.* We proceed by contraposition. Suppose  $n$  is not even. Then  $n$  is odd, and thus can be expressed as  $n = 2k + 1$  for some  $k \in \mathbb{Z}$ . Then:

$$\begin{aligned} n^2 &= (2k + 1)(2k + 1) \\ &= 4k^2 + 4k + 1 \end{aligned}$$

Since the integers are closed under addition and multiplication, then  $4k^2 + 4k \in \mathbb{Z}$ . Thus,  $n^2$  is odd. □

**4.3 Rational Numbers  $\mathbb{Q}$** 

We can further expand this number system by the following:

1. Include **multiplicative inverses** (for all  $n \in \mathbb{Z} \setminus \{0\}$ , define  $1/n$  such that  $n \cdot 1/n = 1$ )
2. Define  $m \cdot 1/n := m/n$  when  $n \neq 0$ .

From this, we can construct the set of rational numbers.

**Definition 4.3.1 ▶ Rational Numbers  $\mathbb{Q}$** 

The set of **rational numbers** is defined as:

$$\mathbb{Q} := \left\{ \frac{m}{n} : m, n \in \mathbb{Z} \wedge n \neq 0 \right\}$$

To ensure multiplication works as intended, we also define  $\frac{m}{n} \cdot \frac{k}{l} := \frac{m \cdot k}{n \cdot l}$ .

We say  $\frac{m_1}{n_1} = \frac{m_2}{n_2}$  if and only if  $m_1 n_2 = m_2 n_1$  where  $n_1, n_2 \neq 0$ . In other words,  $\frac{m_1}{n_1} \sim \frac{m_2}{n_2} \iff m_1 n_2 = m_2 n_1$ . Thus,  $\mathbb{Q}$  is the set of equivalence classes for this relation.

If  $n = kp$  and  $m = kq$ , where  $k, p, q \in \mathbb{Z}$ ,  $k \neq 0$ ,  $q \neq 0$ , then:

$$\frac{n}{m} = \frac{kp}{kq} = \frac{k}{q}, \quad \text{because } kpq = kqp$$

If  $n$  and  $m$  have no common factor (except  $\pm 1$ ), then we say that  $n/m \in \mathbb{Q}$  is in the “lowest terms” or “reduced terms”. The set  $(\mathbb{Q}, +, \cdot)$  forms a field. However, we cannot write  $x = n/m$

where  $x^2 = 2$ .

### Theorem 4.3.1 ▶ $\sqrt{2}$ is not a Rational Number

$$\sqrt{2} \notin \mathbb{Q}$$

*Proof.* Suppose for contradiction  $\sqrt{2}$  is a rational number. Then, there exist  $n, m \in \mathbb{Z}$  such that  $(n/m)^2 = 2$ . If  $n = kp$  and  $m = kq$ , then we can “cancel” the common factor  $k$  to write  $n/m = p/q$ . That is, we can assume that  $n$  and  $m$  have no (non-trivial) common factors. Now,  $n^2/m^2 = 2$ , so by multiplying both sides by  $m^2$ , we get  $n^2 = 2m^2$ . Thus,  $n^2$  is an even number, so  $n$  is also even (Example 4.2.1). Then, we can write  $n = 2k$  where  $k \in \mathbb{Z}$ . Then:

$$\implies (2k)^2 = 2m^2$$

$$\implies 4k^2 = 2m^2$$

$$\implies 2k^2 = m^2$$

Then  $m^2$  is even, so  $m$  is even. Thus,  $m$  and  $n$  are both even, so they are multiples of 2. This contradicts the fact that we defined  $n/m$  in the lowest terms.  $\square$

Does there exist  $r \in \mathbb{Q}$  such that  $r^2 = 3$ ?

### Definition 4.3.2 ▶ Divides

For  $a, b \in \mathbb{Z}$ , we say  $a$  **divides**  $b$  if  $b$  is a multiple of  $a$ .

$$a \mid b \iff \exists(c \in \mathbb{Z})(b = ac)$$

### Theorem 4.3.2 ▶ Division Algorithm

Suppose  $a, b \in \mathbb{Z}$ . Then  $a = kb + r$  where  $k \in \mathbb{Z}$  and  $r \in \mathbb{Z}$  where  $0 \leq r < a$ .

### Example 4.3.1

If  $p \in \mathbb{N}$  and  $3 \mid p^2$ , then  $3 \mid p$ .

*Proof.* By the division algorithm,  $p = 3k + j$  where  $k \in \mathbb{Z}$  and  $j \in \mathbb{Z}$  where  $0 \leq j < 3$ . Then,  $p^2 = (3k + j)^2 = 9k^2 + 6kj + j^2$ . Suppose that  $3 \mid p^2$ . Then,  $p^2 = 3l = 9k^2 + 6kj + j^2$ . Thus:

$$j^2 = 3l - 9k^2 - 6kj = 3(l - 3k^2 - 2kj)$$

We have  $3 \mid j^2$ . Hence,  $j \neq 1, j \neq 2$ , leaving only  $j = 0$ . Therefore,  $p = 3k + 0$ , so  $3 \mid p$ .  $\square$

#### Example 4.3.2 $\sqrt{3}$ is not a Rational Number

*Proof.* Suppose for contradiction  $\sqrt{3}$  is a rational number. Then, there exist  $n, m \in \mathbb{Z}$  such that  $(n/m)^2$ . If  $n$  and  $m$  share a common factor, then we can “cancel” the common factor to where  $n/m = kp/kq = p/q$ . Thus, we may assume that  $n$  and  $m$  have no nontrivial common factor.

$$\begin{aligned} \left(\frac{n}{m}\right)^2 &= 3 \\ \implies \frac{n^2}{m^2} &= 3 \\ \implies n^2 &= 3m^2 \end{aligned}$$

Thus,  $3 \mid n^2$ , so  $3 \mid n$  by the previous lemma. Writing  $n = 3k$  for some  $k \in \mathbb{Z}$ , we have:

$$\begin{aligned} (3k)^2 &= 3m^2 \\ \implies 9k^2 &= 3m^2 \\ \implies 3k^2 &= m^2 \end{aligned}$$

That is,  $3 \mid m^2$  so  $3 \mid m$ . Thus, 3 divides both  $n$  and  $m$ . This contradicts the fact that we defined  $n/m$  in the lowest terms.  $\square$

## 4.4 Fields

### Definition 4.4.1 $\blacktriangleright$ Field

A **field** is a set  $F$  with two defined operations, addition and multiplication, satisfying the following for all  $a, b, c \in F$ :

Axiom	Addition	Multiplication
<b>Associativity</b>	$(a + b) + c = a + (b + c)$	$(ab)c = a(bc)$
<b>Commutativity</b>	$a + b = b + a$	$ab = ba$
<b>Distributivity</b>	$a(b + c) = ab + ac$	$(a + b)c = ac + bc$
<b>Identities</b>	$\exists(0 \in \mathbb{F})(a + 0 = a)$	$\exists(1 \in \mathbb{F})(1 \neq 0 \wedge 1a = a)$
<b>Inverses</b>	$\exists(-a \in \mathbb{F})(a + (-a) = 0)$	$(a \neq 0) \iff \exists(a^{-1} \in \mathbb{F})(aa^{-1} = 1)$

All the “standard facts” of arithmetic and algebra in  $\mathbb{R}$  follows from these axioms.

$\mathbb{Q}$ ,  $\mathbb{R}$ , and  $\mathbb{C}$  are infinite fields, but  $\mathbb{Z}_p$  (arithmetic modulo  $p$ ) is a finite field if  $p$  is prime.

More generally,  $F_q$  where  $q = p^k$  is a finite field.

#### Theorem 4.4.1 ► Facts about Fields

Let  $F$  be a field. For all  $a, b, c \in F$ :

- (a) if  $a + c = b + c$ , then  $a = b$
- (b)  $a \cdot 0 = 0$
- (c)  $(-a) \cdot b = -(a \cdot b)$
- (d)  $(-a) \cdot (-b) = a \cdot b$
- (e) if  $a \cdot c = b \cdot c$  and  $c \neq 0$ , then  $a = b$
- (f) if  $a \cdot b = 0$ , then  $a = 0$  or  $b = 0$
- (g)  $-(-a) = a$
- (h)  $-0 = 0$

*Proof of (g).*

$$\begin{aligned}
 -(-a) &= -(-a) + 0 \\
 &= -(-a) + (a + (-a)) \\
 &= -(-a) + (-a + a) \\
 &= (-(-a) + (-a)) + a \\
 &= ((-a) + -(-a)) + a \\
 &= 0 + a \\
 &= a + 0 \\
 &= a
 \end{aligned}$$

## 4.5 Ordered Fields

### Definition 4.5.1 ► Ordered Field

An **ordered field** is a field with a relation  $<$  such that for all  $a, b, c \in F$ :

Axiom	Description
<b>Trichotomy</b>	Only one is true: $a < b$ , $a = b$ , or $b < a$
<b>Transitivity</b>	if $a < b$ and $b < c$ then $a < c$
<b>Additive Property</b>	if $b < c$ , then $a + b < a + c$
<b>Multiplicative Property</b>	if $b < c$ and $0 < a$ , then $a \cdot b < a \cdot c$

We then define  $>$  as the inverse relation of  $<$ .

### Theorem 4.5.1 ► Facts about Ordered Fields

- if  $a < b$  then  $-b < -a$
- if  $a < b$  and  $c < 0$ , then  $cb < ca$
- if  $a \neq 0$ , then  $a^2 = a \cdot a > 0$
- $0 < 1$
- if  $0 < a < b$  then  $0 < 1/b < 1/a$

Although  $\mathbb{C}$  is a field, it is not an ordered field. We can certainly define some kind of “order” on  $\mathbb{C}$ , but there is no way to make it satisfy the four axioms of an ordered field. For example,  $i^2 = -1 < 0$ , contradicting the fact that any nonzero number’s square is greater than 0 in an ordered field.

$\mathbb{R}$  and  $\mathbb{Q}$  are ordered fields.

### Definition 4.5.2 ► Absolute Value

Let  $F$  be an ordered field. For  $a \in F$ , we define the **absolute value** of  $a$  as:

$$|a| := \begin{cases} a, & a \geq 0 \\ -a, & a < 0 \end{cases}$$

We can think of  $|a - b|$  as the distance between  $a$  and  $b$ . More generally,  $|a - b| = d(a, b)$  is the metric we are using.

#### Theorem 4.5.2 ► Properties of Absolute Value

- $|a| \geq 0$ ,  $a \leq |a|$ , and  $-a \leq |a|$
- $|ab| = |a||b|$

#### Theorem 4.5.3 ► Triangle Inequality

Let  $F$  be an ordered field. For any  $a, b \in F$ ,  $|a + b| \leq |a| + |b|$ .

*Proof.* There are two cases to consider. If  $a + b \geq 0$ , then:

$$\begin{aligned} |a + b| &= a + b \\ &\leq |a| + b \\ &\leq |a| + |b| \end{aligned}$$

If  $a + b < 0$ , then:

$$\begin{aligned} |a + b| &= -(a + b) \\ &= -a - b \\ &\leq |a| - b \\ &\leq |a| + |b| \end{aligned}$$

□

## 4.6 Completeness

#### Definition 4.6.1 ► Bounded Above, Bounded Below, Bounded

Let  $F$  be an ordered field, and let  $A \subseteq F$ .

- $A$  is **bounded above** if there exists  $b \in F$  such that  $a \leq b$  for all  $a \in A$ . In this context,  $b$  is an **upper bound** for  $A$ .
- $A$  is **bounded below** if there exists  $c \in F$  such that  $c \leq a$  for all  $a \in A$ . In this context,  $c$  is a **lower bound** for  $A$ .
- $A$  is **bounded** if  $A$  is bounded above and bounded below.

**Example 4.6.1 ▶ Upper and Lower Bounds**

Consider the set  $(0, 1) := \{x \in \mathbb{R} : 0 < x < 1\}$ .

- $(0, 1)$  is bounded above by 1 and any number greater than 1.
- $(0, 1)$  is bounded below by 0 and any negative number.

Consider the set  $[3, \infty) := \{x \in \mathbb{R} : 3 \leq x\}$ .

- $[3, \infty)$  is not bounded above.
- $[3, \infty)$  is bounded below by 3 and any number less than 3.

**Definition 4.6.2 ▶ Maximum, Minimum**

Let  $F$  be an ordered field, and let  $A \subseteq F$ .

- If there exists  $M \in A$  such that  $M$  is an upper bound for  $A$ , then  $M$  is the **maximum** of  $A$ , denoted  $M = \max A$
- If there exists  $m \in A$  such that  $m$  is a lower bound for  $A$ , then  $m$  is the **minimum** of  $A$ , denoted  $m = \min A$ .

Note that from the above example,  $(0, 1)$  has neither a maximum nor a minimum. However, 3 is the minimum of  $[3, \infty)$ .

**Definition 4.6.3 ▶ Supremum**

Let  $F$  be an ordered field, and let  $A \subseteq F$ .  $s \in F$  is a **supremum** of  $A$  if:

1.  $s$  is an upper bound for  $A$ , and
2. if  $t$  is an upper bound for  $A$ , then  $s \leq t$ .

In other words, the supremum is the least upper bound for  $A$ . If  $A$  has a supremum, then that supremum is unique. (TODO: Prove this)

**Theorem 4.6.1 ▶ Maximum is the Supremum**

Let  $F$  be an ordered field, and let  $A \subseteq F$ . If  $A$  has a maximum  $M$ , then  $M = \sup A$ .

*Proof.* Since  $M = \max A$ , we know  $M$  is an upper bound for  $A$ . Let  $t$  be an upper bound for  $A$ . Since  $M \in A$ , then  $t \geq M$ . Thus,  $M$  is less than or equal to any upper bound  $t$ , so  $M = \sup A$ . □

**Example 4.6.2 ▶ Supremum of  $(0, 1)$** 

Prove that  $\sup(0, 1) = 1$ .

*Proof.* First, note that 1 is an upper bound for  $(0, 1)$ . Next, suppose that  $t \in \mathbb{Q}$  is an upper bound for  $(0, 1)$ . Since  $0 < 1/2 < 1$ , then  $0 < 1/2 \leq t$ . By transitivity,  $t > 0$ . Suppose for contradiction  $t < 1$ . Because  $0 < t < 1$ , we have  $1 < 1 + t < 2$ . Dividing across by 2, we have  $1/2 < 1 + t/2 < 1$ . That is,  $1 + t/2 \in (0, 1)$ . But  $t < 1$ , so  $2t < 1 + t$ . Thus,  $t < 1 + t/2$ . This contradicts our assumption that  $t$  is an upper bound for  $(0, 1)$ . Therefore,  $t \geq 1$ , so  $\sup(0, 1) = 1$ .  $\square$

**Definition 4.6.4 ▶ Completeness**

An ordered field  $F$  is **complete** if every nonempty subset of  $F$  that is bounded above has a supremum in  $F$ .

**Theorem 4.6.2 ▶  $\mathbb{Q}$  is not complete**

*Proof sketch.* Let  $A := \{x \in \mathbb{Q} : x^2 < 2\}$ . In other words,  $A = (-\sqrt{2}, \sqrt{2}) \subseteq \mathbb{Q}$ . Then  $A$  is nonempty and bounded above. Suppose for contradiction that  $\mathbb{Q}$  is complete. Then  $A$  has a supremum, say  $s = \sup(A)$ . Consider the following cases:

1. If  $s^2 < 2$ , let  $n \in \mathbb{N}$  such that  $(s + 1/n)^2 < 2$ . Then  $s + 1/n \in A$ , contradicting  $s$  being an upper bound for  $A$ .
2. If  $s^2 > 2$ , let  $n \in \mathbb{N}$  such that  $(s - 1/n)^2 > 2$ . Then  $s - 1/n$  is an upper bound smaller than  $s$ , contradicting  $s$  being the least upper bound (supremum).
3. If  $s^2 = 2$ , then  $s \notin \mathbb{Q}$  (Theorem 4.3.1).

Thus,  $A \subseteq \mathbb{Q}$  does not have a supremum. Therefore,  $\mathbb{Q}$  is not complete.  $\square$

**Definition 4.6.5 ▶ Real Numbers  $\mathbb{R}$** 

The **real numbers** are a set  $\mathbb{R}$  with two operations,  $+$  and  $\cdot$ , and order relation  $<$  such that:

1.  $(\mathbb{R}, +, \cdot)$  is a field,
2.  $(\mathbb{R}, +, \cdot, <)$  is an ordered field, and
3.  $(\mathbb{R}, +, \cdot, <)$  is complete.

Alternatively,  $\mathbb{R}$  can be constructed explicitly using “Dedekind cuts”. Either way,  $\mathbb{R}$  is the **only**

unique complete ordered field up to isomorphism. That is, if there is some other imposter complete ordered field  $\mathbb{R}'$ , we can map every element of  $\mathbb{R}$  to  $\mathbb{R}'$  such that we preserve all the operations and relations between things in  $\mathbb{R}$ . More formally, there exists an isomorphism  $T : \mathbb{R} \rightarrow \mathbb{R}'$  where  $T$  is bijective, and:

- $T(x + y) = T(x) + T(y)$
- $T(xy) = T(x)T(y)$
- $x < y \iff T(x) < T(y)$

Additionally,  $\mathbb{N} \subseteq \mathbb{R}$  where  $\mathbb{N}$  satisfies the Peano axioms.

#### Theorem 4.6.3 ▶ $\sqrt{2}$ is a Real Number

*Proof sketch.* Let  $A := \{x \in \mathbb{R} : x^2 < 2\}$ .

- Show  $A \neq \emptyset$  and  $A$  is bounded above
- Completeness says  $s := \sup A$  exists
- Show  $s^2 = 2 \implies s = \sqrt{2} \in \mathbb{R}$ .

More generally, if  $n, m \in \mathbb{N}$ , then  $\sqrt[n]{m} \in \mathbb{R}$ .

# Suprema and Infima

## Definition 5.0.1 ► Infimum

Let  $F$  be an ordered field, and let  $A \subseteq F$ .  $s$  is the *infimum* of  $A$  if:

1.  $s$  is a lower bound for  $A$ , and
2.  $s$  is greater than every other lower bound for  $A$ .

We can prove that the existence of infima is already implied by completeness.

## Theorem 5.0.1 ► Existence of Infima in $\mathbb{R}$

Let  $A \subseteq \mathbb{R}$  be nonempty and bounded below. Then  $A$  has an infimum in  $\mathbb{R}$ .

*Proof.* Let  $A \subseteq \mathbb{R}$  be nonempty and bounded below. Let  $B$  be the set of all lower bounds for  $A$ . In other words,  $B := \{b \in \mathbb{R} : \forall(a \in A)(b < a)\}$ . Since  $A$  is bounded below, then  $B$  is nonempty. Note also that  $B$  is bounded above by element of  $A$ . By completeness,  $s := \sup B$  exists. Now, we need to show that  $\sup B = \inf A$ .

1. Every  $a \in A$  is an upper bound for  $B$ , and  $\sup B$  is the least upper bound for  $B$ . Then,  $\sup B \leq a$ . That is,  $\sup B$  is a lower bound for  $A$ .
2. Let  $t$  be a lower bound for  $A$ . Then, by definition of  $B$ , it follows that  $t \in B$ . Then  $t \leq \sup B$  as required.

Therefore,  $\sup B = \inf A$  in  $\mathbb{R}$ . □

## Theorem 5.0.2 ► Well-Ordering Principle

Every non-empty subset of  $\mathbb{N}$  has a minimum.

*Proof.* We will use induction. For convenience, let  $P(n)$  represent the following statement: “If  $A \subseteq \mathbb{N}$  and  $A \cap \{1, 2, \dots, n\} \neq \emptyset$ , then  $A$  has a minimum.”

**Base Case:** First, we will prove  $P(1)$ . If  $A \subseteq \mathbb{N}$  and  $A \cap \{1\} \neq \emptyset$ , then  $1 \in A$ , so  $A$  has a minimum.

**Induction Step:** Assume that  $P(n)$  holds for some  $n \in \mathbb{N}$ . Suppose  $A \subseteq \mathbb{N}$  and  $A \cap \{1, 2, \dots, n+1\} \neq \emptyset$ .

1. If  $A \cap \{1, 2, \dots, n\} \neq \emptyset$ , then  $A$  has a minimum by  $P(n)$ .
2. If  $A \cap \{1, 2, \dots, n\} = \emptyset$ , then  $n + 1 \in A$ , so  $\min A = n + 1$ .

By induction,  $P(n)$  holds for all  $n \in \mathbb{N}$ . If  $A \subseteq \mathbb{N}$  and  $A \neq \emptyset$ , then there exists  $m \in A$  such that  $m \in \mathbb{N}$ . By  $P(m)$  (which is true by induction), the set  $A$  has a minimum.  $\square$

### Theorem 5.0.3 ► Pushing Supremum

Let  $A$  be a nonempty subset of  $\mathbb{R}$ , and let  $b, c$  be real numbers.

- (a) If  $a \leq b$  for all  $a \in A$ , then  $\sup A \leq b$ .
- (b) If  $c \leq a$  for all  $a \in A$ , then  $c \leq \inf A$ .

**Intuition:** Consider the interval  $A := (0, 1)$ . Because  $a \leq 1$  for all  $a \in (0, 1)$ , we have  $\sup A \leq 1$ . Because  $0 \leq a$  for all  $a \in (0, 1)$ , we have  $0 \leq \inf A$ .

*Proof of (a).* Since  $a \leq b$  for all  $a \in A$ , then  $b$  is an upper bound for  $A$ . By completeness,  $A$  has a supremum, and  $s := \sup A$  is the least upper bound for  $A$ . Thus,  $s \leq b$ .  $\square$

*Proof of (b).*  $\square$

### Example 5.0.1

Suppose  $A, B \subseteq \mathbb{R}$ ,  $A \neq \emptyset$ ,  $A \subseteq B$ , and  $B$  is bounded above. Prove that  $A$  is bounded above and  $\sup A \leq \sup B$ .

*Proof.* Since  $A \subseteq B$  and  $A \neq \emptyset$ , then  $B \neq \emptyset$ . Also,  $B$  is bounded above, so  $B$  has a supremum (by completeness). Let  $a \in A$  be arbitrary. Then  $a \in B$ , so  $a \leq \sup B$ . Thus,  $A$  is bounded above, so  $A$  has a supremum (by completeness). By Pushing Supremum,  $\sup A \leq \sup B$ .  $\square$

### Theorem 5.0.4 ► Approximation Property of Suprema and Infima

Suppose  $A$  is a nonempty subset of  $\mathbb{R}$ , and  $s, r \in \mathbb{R}$ . Then:

- (a)  $s = \sup A$  if and only if (i)  $s$  is an upper bound for  $A$ , and (ii) for all  $\epsilon > 0$ , there exists  $a \in A$  such that  $s - \epsilon < a$ .
- (b)  $r = \inf A$  if and only if (i)  $r$  is a lower bound for  $A$ , and (ii) for all  $\epsilon > 0$ , there exists  $a \in A$  such that  $a < r + \epsilon$ .

**Intuition:** If we nudge the supremum ever so slightly to the left, then we must have moved past something in  $A$ .

*Proof of (a).* Let  $s := \sup A$ . Then (i) holds by definition of suprema. To prove (ii), let  $\epsilon > 0$ . Since  $s - \epsilon < s$ , then  $s - \epsilon$  is not an upper bound for  $A$ . Therefore, there exists  $a \in A$  such that  $s - \epsilon < a$ .

Conversely, suppose that (i) and (ii) hold. We need to show  $s = \sup A$ . From (i), we know that  $s$  is an upper bound for  $A$ . Now, we need to show that  $s$  is the least upper bound. Let  $t$  be an upper bound for  $A$ . Suppose for contradiction that  $t < s$ . Let  $\epsilon := s - t > 0$ . Then  $t = s - \epsilon$ . By (ii), there exists  $a \in A$  such that  $a > s - \epsilon = t$ . This contradicts  $t$  being an upper bound for  $A$ . Thus, there is no upper bound less than  $s$ . Therefore,  $s = \sup A$ .  $\square$

## 5.1 Consequences of Completeness

### Theorem 5.1.1 $\blacktriangleright \mathbb{N}$ is not Bounded Above

*Proof.* Suppose for contradiction  $\mathbb{N}$  is bounded above. Since  $\mathbb{N}$  is not empty, then  $\mathbb{N}$  has a supremum in  $\mathbb{R}$ . Let  $s := \sup \mathbb{N} \in \mathbb{R}$ . Then  $n \leq s$  for all  $n \in \mathbb{N}$ . By the Peano axioms,  $n$  has a successor  $n + 1 \in \mathbb{N}$ , so  $n + 1 \leq s$  for all  $n \in \mathbb{N}$ . Therefore,  $n \leq s - 1$  for all  $n \in \mathbb{N}$ . This contradicts  $s$  being the least upper bound for  $\mathbb{N}$ .  $\square$

### Theorem 5.1.2 $\blacktriangleright$ Archimedean Principle

Suppose  $x, y \in \mathbb{R}$  where  $x > 0$ . Then, there exists  $n \in \mathbb{N}$  such that  $nx > y$ .

**Intuition:** This is basically an extension of the fact that  $\mathbb{N}$  is not bounded above.

*Proof.* Since  $y/x$  is not an upper bound for  $\mathbb{N}$ , then there exists  $n \in \mathbb{N}$  such that  $n > y/x$ . Since  $x > 0$ , then  $nx > y$ .  $\square$

### Theorem 5.1.3 $\blacktriangleright$ Density of $\mathbb{Q}$ in $\mathbb{R}$

Suppose  $x, y \in \mathbb{R}$  where  $x < y$ . Then there exists  $r \in \mathbb{Q}$  such that  $x < r < y$ .

**Intuition:** Given any two different real numbers, there's some rational number between them.

*Proof.* We will consider three cases:

1. If  $x \geq 0$ , then  $0 \leq x < y$ . Since  $y - x > 0$ , then by the Archimedean Principle, there exists  $n \in \mathbb{N}$  such that  $n(y - x) > 1$ . We want to show there is a natural number between  $nx$  and  $ny$ . Let  $A := \{k \in \mathbb{N} : k > nx\}$ . Since  $\mathbb{N}$  isn't bounded above, then  $A$  is not empty. By the Well-Ordering Principle,  $A$  has a minimum. Let  $m := \min A$ . Then  $m > nx$ , and  $m - 1 \leq nx$ . Thus,  $m \leq nx + 1$ , so:

$$nx < m \leq nx + 1 < ny$$

Dividing across by  $n$  yields  $x < m/n < y$ . Note that  $m, n \in \mathbb{N} \subseteq \mathbb{Z}$ , so  $m/n \in \mathbb{Q}$ .

2. If  $x < 0$  and  $y > 0$ , then  $x < 0 < y$  where  $0 \in \mathbb{Q}$ .
3. If  $x < 0$  and  $y \leq 0$ , then  $x < y \leq 0$ . Multiplying across by  $-1$ , we have  $-x > -y \geq 0$ . By the first case, there must exist  $t \in \mathbb{Q}$  where  $-y < t < -x$ . Multiply across by  $-1$  again to attain  $y > -t > x$  where  $-t \in \mathbb{Q}$ .

This completes the proof. □

#### Theorem 5.1.4 $\sqrt{2}$ is a Real Number

There exists  $s \in \mathbb{R}$  such that  $s^2 = 2$ .

*Proof.* Let  $A := \{x \in \mathbb{R} : x^2 < 2\}$ . Since  $0^2 < 2$ , then  $0 \in A$ , so  $A$  is not empty. Also,  $A$  is bounded above, for example by 2. By completeness,  $A$  must have a supremum in  $\mathbb{R}$ . Let  $s := \sup A$ . We will use trichotomy to show that  $s^2 = 2$ .

1. If  $s^2 > 2$ , then...

**Scratchwork:** We need to show that this is not possible, i.e. show there is some  $s - 1/n$  that is less than  $s$  but is still an upper bound for  $A$ . We want  $(s - 1/n)^2 > 2$ . Then,  $s^2 - 2s/n + 1/n^2 > 2$ . We can chop off the  $1/n^2$ , reducing the inequality to  $s^2 - 2s/n > 2$ . Thus, we need to choose  $n > \frac{2s}{s^2 - 2}$ .

... let  $n \in \mathbb{N}$  such that  $n > \frac{2s}{s^2-2}$ . Then:

$$\begin{aligned} & n > \frac{2s}{s^2-2} \\ \implies & s^2 - \frac{2s}{n} > 2 \\ \implies & s^2 - \frac{2s}{n} + \frac{1}{n^2} > 2 \\ \implies & \left(s - \frac{1}{n}\right)^2 > 2 \end{aligned}$$

Thus,  $s - 1/n$  is an upper bound for  $A$  that is less than  $s$ . This contradicts  $s$  being the supremum for  $A$ .

2. If  $s^2 < 2$ , then...

**Scratchwork:** Again, we need to show that this is not possible. We know that in this case,  $s \in A$ , so we need to find another thing in  $A$  that is bigger than  $s$ . In other words, we want some  $(s + 1/n)^2 < 2$ . Then,  $s^2 + 2s/n + 1/n^2 < 2$ . Choose  $n > 1/2s$  and  $n > \frac{4s}{2-s^2}$ .

$$\left(s + \frac{1}{n}\right)^2 = s^2 + \frac{2s}{n} + \frac{1}{n^2}$$

... let  $n \in \mathbb{N}$  such that  $n > \max\left\{\frac{1}{2s}, \frac{4s}{2-s^2}\right\}$ . Then  $\frac{1}{n} < 2s$  and  $s^2 + \frac{4s}{n} < 2$ . So:

$$\begin{aligned} \left(s + \frac{1}{n}\right)^2 &= s^2 + \frac{2s}{n} + \frac{1}{n^2} \\ &< s^2 + \frac{2s}{n} + \frac{2s}{n} \\ &= s^2 + \frac{4s}{n} < 2 \end{aligned}$$

That is,  $s + \frac{1}{n} \in A$ . This contradicts  $s$  being an upper bound for  $A$ .

By trichotomy,  $s^2 = 2$ . □

### Theorem 5.1.5 ▶ Nested Interval Property

Suppose that for each  $n \in \mathbb{N}$ ,  $a_n, b_n \in \mathbb{R}$  with  $a_n \leq b_n$ , and  $a_n \leq a_{n+1} \leq b_{n+1} \leq b_n$  for all  $n \in \mathbb{N}$ . Then  $\bigcap_{n=1}^{\infty} [a_n, b_n] \neq \emptyset$ .

**Intuition:** We can move the two borders of an open interval closer and closer to each other, and it won't be empty.

*Proof.* Note that  $a_n \leq a_{n+1} \leq a_{n+2} \leq \dots$  and  $\dots \leq b_{n+2} \leq b_{n+1} \leq b_n$ . If  $k \leq n$ , then  $a_k \leq a_n \leq b_n$ .

- If  $k \leq n$ , then  $a_k \leq a_n \leq b_n$ .
- If  $k \geq n$ , then  $a_k \leq b_k \leq b_n$ .

That is,  $a_k \leq b_n$  for all  $k, n \in \mathbb{N}$ . Let  $A := \{a_k : k \in \mathbb{N}\}$ . Then  $A$  is bounded above, for example by  $b_1$ . Also,  $A$  is not empty. By completeness,  $A$  has a supremum. Let  $s := \sup A$ . Note that since  $s$  is an upper bound for  $A$ , then  $a_n \leq \sup A$  for all  $n \in \mathbb{N}$ . Also note that  $\sup A$  is the least upper bound for  $A$ , so  $\sup A \leq b_n$  for all  $n \in \mathbb{N}$ . Thus,  $a_n \leq \sup A \leq b_n$  for all  $n \in \mathbb{N}$ , so  $\sup A \in [a_n, b_n]$  for all  $n \in \mathbb{N}$ . Thus,  $\sup A \in \bigcap_{n=1}^{\infty} [a_n, b_n]$ , so it is not empty.  $\square$

The nested interval property is actually false for open intervals!

$$\forall (x \in (0, 1)) \exists (n \in \mathbb{N}) (1/n < x \implies x \notin (0, 1/n))$$

# Cardinality

## Definition 6.0.1 ► Cardinality

**Cardinality** is a measure of the amount of elements in a set, denoted  $|A|$ . We say two sets have the same cardinality if there exists a bijection between them.

For finite sets, we can think of cardinality as the number of elements in that set. For infinite sets, cardinality can sometimes go against our intuition. For any sets  $A, B, C$ :

1.  $|A| = |A|$
2. if  $|A| = |B|$ , then  $|B| = |A|$
3. if  $|A| = |B|$  and  $|B| = |C|$ , then  $|A| = |C|$ .

Hence, cardinality is an equivalence relation.

## Example 6.0.1 ► Cardinality of $\mathbb{N}$ and $2\mathbb{N}$

Let  $2\mathbb{N} := \{2n : n \in \mathbb{N}\}$  (i.e. the set of even natural numbers). Then  $|\mathbb{N}| = |2\mathbb{N}|$ .

*Proof.* To show that these two sets have the same cardinality, we need to find some bijection between the sets. Let  $f : \mathbb{N} \rightarrow 2\mathbb{N}$  be a function defined by  $f(n) = 2n$ . Note that  $f$  is well-defined (i.e. is actually a function) because  $f(n) \in 2\mathbb{N}$  for all  $n \in \mathbb{N}$ . To prove that  $f$  is a bijection, we need to prove it is both injective and surjective.

1. Let  $n_1, n_2 \in \mathbb{N}$  such that  $f(n_1) = f(n_2)$ . Then  $2n_1 = 2n_2$ , so  $n_1 = n_2$ . Thus,  $f$  is injective.
2. Let  $m \in 2\mathbb{N}$ . Then  $m = 2k$  for some  $k \in \mathbb{N}$ , so  $m = 2k = f(k)$  for some  $k \in \mathbb{N}$ . Thus,  $f$  is surjective.

Therefore,  $f$  is a bijection, so  $|\mathbb{N}| = |2\mathbb{N}|$ . □

## Example 6.0.2 ► Cardinality of Intervals

Let  $a, b \in \mathbb{R}$  where  $a < b$ . Then  $|(0, 1)| = |(a, b)|$ .

*Proof.* We need to find a bijection from  $(0, 1)$  to  $(a, b)$ . We need to “scale” the interval  $(0, 1)$  to the width of  $(a, b)$ , then translate it to match  $(a, b)$ . Define  $f : (0, 1) \rightarrow (a, b)$  by

$f(x) = a + (b - a)x$ . (We need to check  $f$  is well-defined). Let  $x \in (0, 1)$ . Then  $0 < x < 1$ , so multiplying by  $(b - a)$  which is positive gives  $0 < (b - a)x < b - a$ . Adding  $a$ , we get  $a < a + (b - a)x < b$ . Now we need to show  $f$  is a bijection:

1. Let  $x_1, x_2 \in (0, 1)$  such that  $f(x_1) = f(x_2)$ . Then  $a + (b - a)x_1 = a + (b - a)x_2$ . Subtracting  $a$  from both sides, we get  $(b - a)x_1 = (b - a)x_2$ . Since  $(b - a) \neq 0$ , we can divide both side by  $(b - a)$  to get  $x_1 = x_2$ .
2. Let  $y \in (a, b)$ .

**Scratchwork:** We want to find some  $x \in (0, 1)$  where  $y = f(x) = a + (b - a)x$ . Using some algebra to solve for  $x$ , we have  $x = \frac{y - a}{b - a}$

Let  $x = \frac{y - a}{b - a}$ . First, we show  $x \in (0, 1)$ :

$$\begin{aligned} & a < y < b \\ \implies & 0 < y - a < b - a \\ \implies & 0 < \frac{y - a}{b - a} < 1 \end{aligned}$$

Thus,  $x \in (0, 1)$ . Also:

$$f(x) = a + (b - a)\left(\frac{y - a}{b - a}\right) = a + (y - a) = y$$

Thus,  $f$  is surjective.

Therefore,  $f$  is a bijective, so  $|(0, 1)| = |(a, b)|$ . □

### Definition 6.0.2 ► Power Set

Let  $A$  be a set. The **power set** of  $A$  is the set of all subsets of  $A$ .

$$\mathcal{P}(A) = \{B : B \subseteq A\}$$

For example, the power set of  $\{1, 2, 3\}$  is  $\{\emptyset, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}, \{1, 2, 3\}\}$ . For any finite set with  $n$  elements in it, its power set has  $2^n$  elements in it.

**Example 6.0.3 ▶ Cardinality of  $\mathbb{N}$  and  $\mathcal{P}(\mathbb{N})$** 

$$|\mathbb{N}| \neq |\mathcal{P}(\mathbb{N})|$$

*Proof.* We will show that any function  $f : \mathbb{N} \rightarrow \mathcal{P}(\mathbb{N})$  cannot be surjective, and thus not bijective. Let  $f : \mathbb{N} \rightarrow \mathcal{P}(\mathbb{N})$  be any function defined by  $f(n) = A_n$ . Note  $A_n \subseteq \mathbb{N}$ , so  $A_n \in \mathcal{P}(\mathbb{N})$ . Now we will define a set that isn't in  $f[\mathbb{N}]$ . For each  $n \in \mathbb{N}$ , if  $n \in A_n$ , then  $n \notin A$ , and if  $n \notin A_n$ , then  $n \in A$ . More formally,  $A := \{n \in \mathbb{N} : n \notin A_n\}$ . For all  $k \in \mathbb{N}$ , note that:

- if  $k \in A_k$ , then  $k \notin A$ , so  $A \neq A_k$ , and
- if  $k \notin A_k$ , then  $k \in A_k$ , so  $A \neq A_k$ .

Hence,  $A \subseteq \mathbb{N}$ , but  $f(k) \neq A$  for any  $k \in \mathbb{N}$ . Thus,  $f$  is not surjective.  $\square$

**Definition 6.0.3 ▶ Finite, Countably Infinite, Countable, Uncountable**

Let  $A$  be a set. We say  $A$  is:

- **finite** if  $A \neq \emptyset$  or  $|A| = |\{1, 2, \dots, n\}|$  for some  $n \in \mathbb{N}$ .
- **countably infinite** if  $|A| = |\mathbb{N}|$ .
- **countable** if  $A$  is finite or countably infinite
- **uncountable** if  $A$  is not countable

**Theorem 6.0.1 ▶ Cardinality of Power Set of  $\mathbb{N}$** 

the power set of the natural numbers is uncountable.

*Proof.* We know from Example 6.0.3 that  $\mathcal{P}(\mathbb{N})$  is not countably infinite. We need to show that  $\mathcal{P}(\mathbb{N})$  is not finite. Since  $\{1\} \in \mathcal{P}(\mathbb{N})$ , then it cannot be empty. If  $|\{1, 2, \dots, n\}| = |\mathcal{O}(\mathbb{N})|$  for some  $n \in \mathbb{N}$ , then there exists a bijection  $f : \{1, 2, \dots, n\} \rightarrow \mathcal{P}(\mathbb{N})$ . Define  $g : \mathbb{N} \rightarrow \{1, 2, \dots, n\}$  by:

$$g(k) = \begin{cases} k, & 1 \leq k \leq n \\ 1, & k > n \end{cases}$$

Then  $g$  is surjective, so  $f \circ g : \mathbb{N} \rightarrow \mathcal{P}(\mathbb{N})$  is surjective. This contradicts the fact that no such function exists.  $\square$

Generally, there is never a bijection from a set to its power set.
